

LogicFlower user levels

26 accounts, 9 organisations, and the order to check them in

Read this first

The tier rules cannot be verified from one login. An agency reaching only its own clients, a client seeing no sign of the agency above it, corporate seeing counts but never contact names — none of these can FAIL with a single account, so none of them is really tested.

This creates the smallest estate in which every one of those rules can fail, and gives the order to check them in.

Every refusal is checked before the matching permission. Confirming that Agency Alpha can open Ridgeway proves nothing. Confirming it CANNOT open Harlow is the test.

The estate

Two agencies and two direct clients, deliberately. With one of each, the rules that matter cannot fail. Agency Alpha must not open Harlow Fitness; Fairfield must not reach Brightside. Neither is testable without the second one, and those are exactly the boundaries where a leak would be worst.

Creating the accounts

One command. No accounts are created by hand.

Or, running outside Docker:

What the script guarantees

It refuses to run when `NODE_ENV=production`. These are known accounts with derivable passwords and have no business on a real deployment.

Re-running is safe. It resets passwords and roles rather than duplicating anything, so a half-finished run cannot leave an account nobody can sign in to.

The same base secret reproduces the same passwords. Somebody who loses the printout re-runs the script instead of resetting twenty-six accounts.

Every account has its OWN password

Not one shared password. A single leaked credential would otherwise open every tier at once — including corporate, which reaches the whole estate.

Each is derived from the base secret plus that account's email. They are all different, all reproducible, and none of them reveals the base secret or any other account.

The passwords in the table overleaf assume the base secret shown above. Change it and every one of them changes. The script writes the full list to `seed-accounts.local.txt` (git-ignored, mode 0600) — delete it when testing is done.

The accounts

Twenty-six accounts. The last column says what each one exists to prove.

Corporate

You and your own staff. Platform roles, not workspace roles, are what grant this reach.

Email	Password	Workspace	Role	What it proves
corp.owner@seed.local	Lf!NpUF2f0TvyeDioRE9	LogicFlower Corporate	owner platform: owner	Estate + Website + every workspace. Estate must show counts and NEVER a contact name.
corp.admin@seed.local	Lf!EZuUQjg-cEff-oMF9	LogicFlower Corporate	admin platform: admin	Same reach as the owner. Confirm Website writes demand a second factor.
corp.editor@seed.local	Lf!tsP8KRau_uY5hiV89	LogicFlower Corporate	operator platform: admin	Writes the blog. Needs platform admin for /website; an ordinary operator is refused.
corp.support@seed.local	Lf!R8Myq7kyK-KU4D5y9	LogicFlower Corporate	viewer platform: support	Must reach NOTHING until a client approves. Verify the refusal before the grant.
corp.billing@seed.local	Lf!aDwBm7kcAdyqHrs_9	LogicFlower Corporate	billing	Billing and reports only. Should be redirected away from the dashboard.

Agencies

Resellers. Each reaches its own clients and nothing else.

Email	Password	Workspace	Role	What it proves
alpha.owner@seed.local	Lf!RW3R6tvDhi7MpbwP9	Agency Alpha	agency_owner	Clients console. Reaches Ridgeway and Calder. Must NOT reach Harlow or Beta.
alpha.admin@seed.local	Lf!d_KaH9U7ba-cdU3_9	Agency Alpha	admin	Agency staff. Should reach client workspaces but not agency billing.
alpha.operator@seed.local	Lf!bQWSBKgFecGHYZVH9	Agency Alpha	operator	Day-to-day agency work. No Team, Billing or Connections in the sidebar.
alpha.viewer@seed.local	Lf!kxOPkrhVLwsA1MEy9	Agency Alpha	viewer	Read only. No Sequences, Booking, Social, Calling or Workflows offered.
beta.owner@seed.local	Lf!P8Aguj1ZjhKsTJ7l9	Agency Beta	agency_owner	The cross-agency test. Must NOT reach any Agency Alpha client.
beta.operator@seed.local	Lf!DvIyZI5TS8ivd8_09	Agency Beta	operator	Agency staff at the second agency. Must not see Alpha at all.

Client businesses

Your customers. None of them should see any sign of a tier above.

Email	Password	Workspace	Role	What it proves
ridgeway.owner@seed.local	Lf!fp-rA44g-D-dL_M09	Ridgeway Plumbing standing	owner	Full client owner. Sidebar must show NO Agency or Corporate section, in the MARKUP.

Email	Password	Workspace	Role	What it proves
ridgeway.admin@seed.local	Lf!0G83qQU3bSzMAVEs9	Ridgeway Plumbing	admin	Everything except owner-only actions. Cannot change the calling policy.
ridgeway.operator@seed.local	Lf!Nl0PZ32nVUIdh21M9	Ridgeway Plumbing	operator	Sees Sequences, Booking, Social, Calling. Not Team, Billing or Connections.
ridgeway.viewer@seed.local	Lf!LLML7qk1gTro4d0W9	Ridgeway Plumbing	viewer	Read only. This is the least-privilege test; check the sidebar closely.
ridgeway.billing@seed.local	Lf!QVuDfGdIbmecPwyA9	Ridgeway Plumbing	billing	Billing and reports only. Must not reach contacts or the inbox.
ridgeway.customer@seed.local	Lf!1T6vLc_jkQ5kI8dZ9	Ridgeway Plumbing	customer	The narrowest role, and the least tested. Confirm what it can actually reach.
calder.owner@seed.local	Lf!tEYaPpWNmFN0XsEQ9	Calder Dental on request	owner	Agency Alpha must be REFUSED here until this owner approves a request.
calder.operator@seed.local	Lf!3vB_Y4pVI30c8xG09	Calder Dental	operator	Booking-led business. Test the booking page and appointments here.
calder.viewer@seed.local	Lf!ff8Nn3mSBxQg80wZ9	Calder Dental	viewer	Read only inside an on-request workspace.
harlow.owner@seed.local	Lf!zGeaI8JG-RsBE68i9	Harlow Fitness standing	owner	Belongs to Beta. Agency Alpha opening this is a tenant-isolation failure.
harlow.admin@seed.local	Lf!Qtr_-CBPga08mqQz9	Harlow Fitness	admin	Confirm Beta staff reach this and Alpha staff do not.
harlow.operator@seed.local	Lf!QPS3UW2ExtYAYlFw9	Harlow Fitness	operator	Day-to-day work inside a second agency's client.
fairfield.owner@seed.local	Lf!-76THJw4s06yvvqfe9	Fairfield Joinery	owner	Signed up directly. Must be indistinguishable, from inside, from an agency-owned one.
fairfield.operator@seed.local	Lf!Hs4brmTsXJSu1JxB9	Fairfield Joinery	operator	Staff in a direct client. No agency should reach this workspace at all.
brightside.owner@seed.local	Lf!yeDpzL1T3CupbaMP9	Brightside Cleaning	owner	A second direct client. Must not reach Fairfield — client-to-client isolation.

Verify in this order

Each refusal before the matching permission. A test that only confirms something works has not shown the guard exists.

Isolation — a failure here stops a release

☐	1	alpha.owner	Opening Harlow Fitness by organisation id is refused . Harlow belongs to Agency Beta.
☐	2	beta.owner	The Clients console lists Harlow only — never Ridgeway or Calder.
☐	3	fairfield.owner	Cannot reach Brightside, and no agency can reach either. Direct clients answer to nobody.
☐	4	corp.support	Reaches nothing at all until a client approves a request. Verify the refusal first — this is the property customers are asked to trust.
☐	5	corp.owner	The Estate payload contains no contact, message or deal. Check the network response, not the screen: a field fetched but not displayed was still sent.

Client-controlled agency access

☐	6	alpha.owner	Calder shows Request access ; Ridgeway shows Open .
☐	7	calder.owner	Can switch Calder to standing access, and back again.

Least privilege — check the sidebar MARKUP, not just the screen

☐	8	ridgeway.viewer	No Sequences, Booking, Social, Calling or Workflows offered.
☐	9	ridgeway.operator	No Team, Billing, Connections or Vault.
☐	10	ridgeway.billing	Billing and reports only; redirected away from the dashboard.
☐	11	ridgeway.customer	The narrowest role, and the least tested. Confirm what it can actually reach.
☐	12	ridgeway.owner	No Agency or Corporate section anywhere in the DOM . They must be absent, not hidden by a style.

Corporate

☐	13	corp.editor	Can publish a blog article. Needs platform admin plus a second factor.
☐	14	alpha.owner	/website returns 403 . A workspace role, however senior, is not enough.

Modules — one workspace is enough for these

☐	15	ridgeway.owner	Run /setup, publish sequence steps, activate a sequence.
☐	16	calder.operator	Publish a booking page and open the link in a private window.
☐	17	ridgeway.operator	Add a tag and confirm it fires what you expect.

Reporting a failure

Give the check number, the account, and the response body.

Checks 1–5 are tenant isolation and should stop a release. Checks 6–17 are correctness bugs in the navigation or the access resolver — they need fixing, but they do not leak one customer's data to another.

Before you start, and after you finish

Nothing here has run against a real database. The seed script itself is unverified — it was written without a MongoDB to test against. If it fails on the first run, send the error rather than working around it.

These accounts belong on a test deployment only. Delete `seed-accounts.local.txt` when you are done; it holds live passwords for that environment.
